Installing speakers in your pods

Applies to all GolfCartFab speaker pods, including Signature Series and BA Carts Overhead Console / Tray Pods.

1 Pre-drill the speaker mounting holes

Before installing your speakers, pre-drill the mounting holes in the pod's speaker mounting flange according to your speaker manufacturer's recommended hole spacing, placement, and drill size.

If your speaker manufacturer supplies a mounting template, use it to mark the hole locations on the flange. Check the speaker's alignment and mounting-hole positions before drilling.

2 Seal the speaker-to-pod mounting surface

For improved resistance to water and moisture, apply a thin, continuous bead of clear silicone sealant between the speaker's mounting flange and the pod before installing the speaker. Follow the speaker manufacturer's instructions for any supplied gasket, and use a sealant compatible with the speaker and pod materials.

Keep sealant away from the speaker cone, surround, terminals, and any drainage openings. Tighten the mounting screws evenly without overtightening, and allow the sealant to cure according to its instructions before use.

A properly sealed joint may also help reduce air leaks and unwanted rattles.

This step does not make the speaker or pod waterproof.
